SNOW MOLD SUPPRESSION

Snow mold fungus occurs every winter. The factors affecting the severity are: snow depth, length of snow cover, unfrozen ground, excess nitrogen applied mid-fall, creeping bentgrass population, varietal susceptibility and length of turf going into winter. There are two types: pink, does not need snow cover; gray, does need snow cover. **Keep in mind that we are suppressing the disease, not totally eliminating it!**

We are using Procon Z and T-Methyl in a liquid application. This highly effective combination of systemic fungicides is **widely used** on golf course turf with the application timing in early to mid-November.

The cost is twice your spring/crab fertilization rate plus tax.

This is an expensive product and it needs to last all winter for thorough protection. Since it is expensive we can just make an application to the front, back or some other designated area. The cost is proportional with a **\$60 minimum** plus tax and will be billed at the time of the application.

If you have any questions, please give me a call at 634-1393. Please fill out the bottom section and return it to sign up for this application or request further information.

Please return the bottom portion

Make a snow mold preventative application of fungicide to:

- Whole lawn Front only Back only
- Other: please be specific or draw a map _____
- _____

- Send me additional information about snow mold disease.

Please Print
